

Height Safety Specialists Case Study - Access & Traffic to Roof

While it is necessary to protect roof edges with collective means of protection, the means of access to such areas must also be indicated. All products for Cullins are designed to suit the building needs whilst considering the building fabric and aesthetic requirements and complying with legal requirements.

All our products are designed and drafted in CAD format and submitted for approval before manufacture commences, this allows the client to have a say in the design and make changes where necessary.

Every product is trial erected at our premises before taken to site, this ensures a stream-line installation on site.

The unique counter-weighted system as seen opposite, allows the steps to be positioned anywhere on the roof without the need to penetrate the roof surface thereby not effecting the roof warranty.

Available in the following finishes: -

Galvanised

Painted

Tri-Resin powder coated
